

Module 2 overview

lecture

1. Introduction to the module
2. Rational protein design
3. Fluorescence and sensors
4. Protein expression

lab

1. Start-up protein eng.
2. Site-directed mutagenesis
3. DNA amplification
4. Prepare expression system

SPRING BREAK

5. Review & gene analysis
6. Purification and protein analysis
7. Binding & affinity measurements
8. High throughput engineering

5. Gene analysis & induction
6. Characterize expression
7. Assay protein behavior
8. Data analysis

Lecture 4: Protein expression & purification

- I. Why express & purify proteins?
 - A. Scientific applications
 - B. Applications in industry, *etc.*

- II. Protein expression systems
 - A. Alternatives to protein expression
 - B. Prokaryotic and eukaryotic systems

Laboratory uses of purified proteins

Biochemistry analysis

Structural biology

Research biochemicals

Protein therapeutics

Table 1 Top ten recombinant therapeutic proteins and their global sales between 2001 and 2003

Product (generic)/ marketing company	2001 (\$million)	2002 (\$million)	2003 (\$million)	Growth (decline) 2002– 2003 (%)
Procrit (epoetin alfa)/ Johnson & Johnson	3,430	4,269	3,986	(6.6)
Epogen (epoetin alfa)/ Amgen	2,108	2,261	2,435	7.7
Neupogen (filgrastim)/ Amgen	1,346	1,380	1,268	(8.1)
PEGylated Neulasta (pegfilgrastim)/ Amgen	0	464	1,255	170.5
Novolin (insulin systemic)/ Novo Nordisk	2,244	2,255	2,235	(0.9)
Avonex (interferon beta-1a)/ Biogen IDEC	971	1,034	1,170	13.2
PEGylated PEG-Intron A franchise (pegylated interferon alpha)/ Schering Plough	1,447	2,736	1,851	(32.3)
TNF ligand binding domain + Fc antibody domain epo engineered to have additional glycosylation sites Enbrel (etanercept)/ Amgen	856	521	1,300	149.5
Aranesp (darbepoetin alfa)/ Amgen	42	416	1,544	271.2
NeoRecormon (epoetin-beta)/ Roche	479	766	1,318	72.1
<i>Top ten product sales</i>	<i>12,923</i>	<i>16,102</i>	<i>18,362</i>	<i>14.0</i>
<i>Others</i>	<i>8,547</i>	<i>10,833</i>	<i>13,703</i>	<i>26.5</i>
<i>Total market value</i>	<i>21,470</i>	<i>26,935</i>	<i>32,065</i>	<i>19.0</i>

Castor beans, above right, used to manufacture the toxin ricin. (Public domain image, USDA)

How can proteins be produced?

1. Purify from natural source

advantages: no chemistry or DNA manipulation required, proteins likely to fold properly, assemble with native cofactors, *etc.*

disadvantages: usually only practical for high abundance proteins, source-specific purification method required

2. Synthesize *de novo*

advantages: no DNA manipulation required, synthesis methods well established, proteins produced are relatively pure

disadvantages: relatively expensive, becomes extremely difficult for polypeptides > 50 amino acids

3. Express and purify from a dedicated expression system

advantages: cheap and frequently high-yield, versatile expression systems already established

disadvantages: cloning required, troubleshooting often needed to obtain high expression and proper folding

Solid phase peptide synthesis is a reliable technique for generating short polypeptides

E. coli are the most common host for recombinant gene expression

inserted genes may
be homologous or
heterologous
proteins, fusion
proteins, or entirely
novel constructs

Diagrams removed due to copyright restrictions.

**Once a foreign gene has been
introduced, how does protein
expression take place?**

The *lac* operon is the basis for the most common bacterial protein expression systems

Two diagrams removed due to copyright restrictions.

[Lactose Hydrolyzed into Galactose and Glucose; structures of 1,6 allolactose and IPTG](#)

Fig 31.8, *Induction of the LAC Operon*. In Berg, Tymoczko, and Stryer. *Biochemistry*.

5th ed. W. H., Freeman, 2002.

T7 expression system

Other induction systems can also be used for protein expression in *E. coli*: arabinose system is considered to be more tightly controlled than the *lac* operon

Diagrams removed due to copyright restrictions.

ara system is also compatible with T7-based vectors

Differences between prokaryotic and eukaryotic proteins sometimes require eukaryotic expression systems.

These two proteins exemplify characteristics that frequently call for eukaryotic expression:

Three dimensional structure of [bovine rhodopsin](#).

Eukaryotic expression vectors share features with bacterial systems

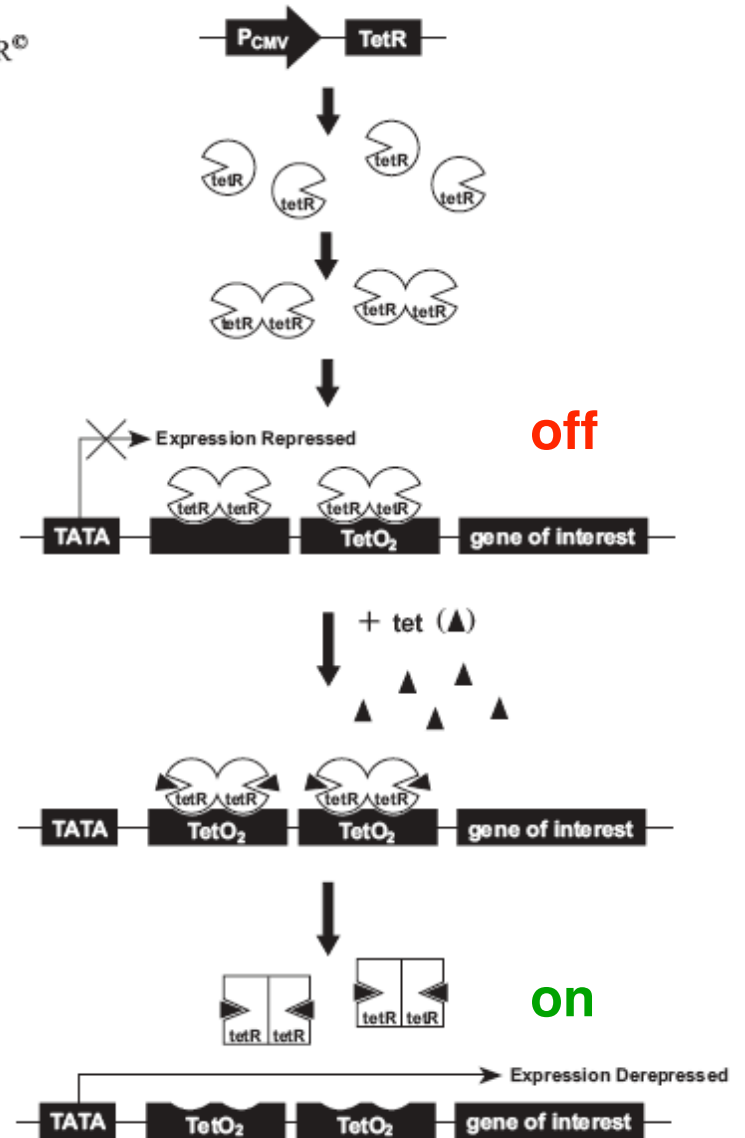

1. Tet repressor (tetR) protein is expressed from pcDNA6/TR[®] in cultured cells.

2. TetR homodimers bind to Tet operator 2 (TetO₂) sequences in the inducible expression vector, repressing transcription of the gene of interest.

3. Upon addition, tetracycline (tet) binds to tetR homodimers.

4. Binding of tet to tetR homodimers causes a conformational change in tetR, release from the Tet operator sequences, and induction of transcription from the gene of interest.

Invitrogen (2006) *T-REx System*

Prokaryotic vs. eukaryotic protein expression

<i>property</i>	<i>prokaryotic</i>	<i>higher eukaryotic</i>
yield/(L culture)	1-100 mg	widely variable
cost/(L medium)	~\$5	~\$50
introduction of DNA	transformation of competent cells	viral or nonviral transfection
handling	sterile needles, <i>etc.</i>	tissue culture hood
cell incubation	shaking incubator	usu. w/CO ₂ -control
induction	usually IPTG	none, tetracycline
glycosylation, <i>etc.</i>	no	yes
<i>notes</i>	best for small, globular proteins	best for complex, eukaryotic proteins
