# Carbon-based nanomaterials

## Basic building block

### Graphite (3D)

van der Waals stack of graphene  
Conductor

Stack

### Graphene (2D)

Single-atom-thick carbon layer  
sp<sup>2</sup> bonding of carbons  
Semi-metal

Roll

### Carbon nanotube (1D)

Rolled graphene  
Semiconductor (2/3) or metal (1/3)

### Diamond (3D)

sp<sup>3</sup> bonding of carbons  
Wide band gap (5.5 eV)

Ball

### Fullerene (0D)

Wide band gap (5.5 eV)

# What is graphene?

## The Point of a Pencil

4 valence electrons in carbon

- 3 bonds to neighbors ( $sp^2$   $\sigma$  bonds)

Structural Rigidity within planes

Weak Van der Waals attraction between planes

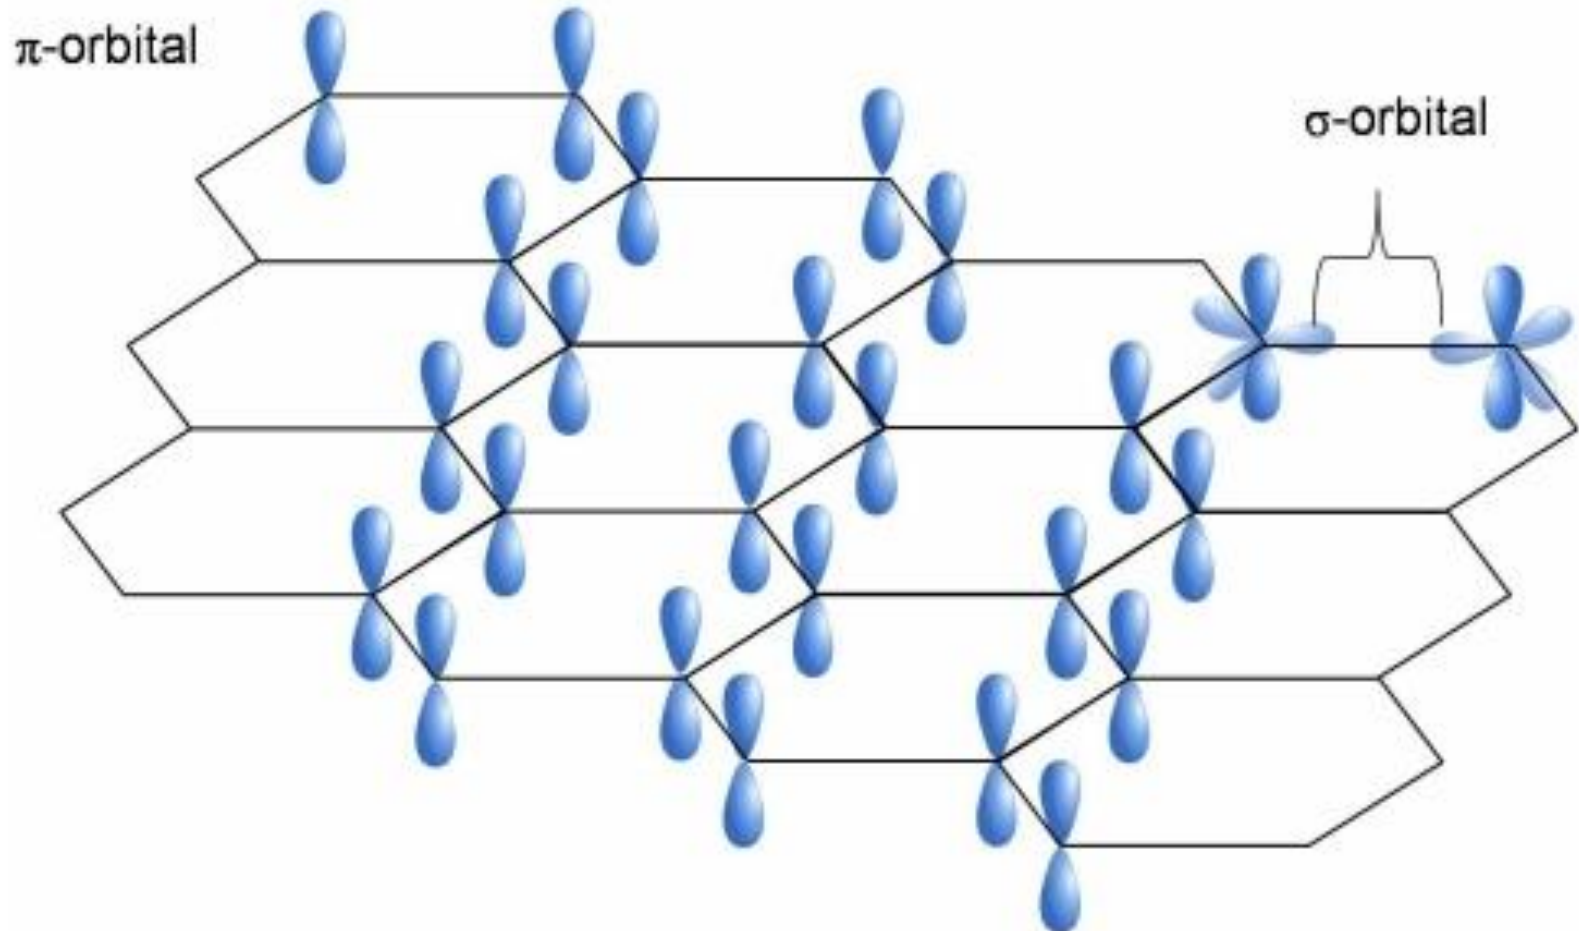

- 1 delocalized  $\pi$  electron

Electrical Conductivity

Graphene = A single layer of graphite

A unique 2D electronic material

# CNT vs Graphene

	CNT	Graphene
Electrical conductivity	~100,000 cm <sup>2</sup> /VS	>100,000 cm <sup>2</sup> /VS
Thermal conductivity	~5000W/K.m	~5000W/K.m
Young's modulus	0.9 ~1.1TPa	1 TPa
Transparency	0	0
Flexibility	0	0

	Electron mobility (cm <sup>2</sup> /Vs)	Electrical characteristics
Copper	5,770	Conductor
Silver	9,490	Conductor
GaAs	6,000	Semiconductor
Si	1,350	Semiconductor
Graphene/CNT	>100,000	Semi-metal

# Challenges for Carbon Nanotube Applications

- Control the diameter of nanotubes and chirality.
  - Purification/sorting methods required for uniform CNT
- Large scale integration
  - Placement/alignment methods required for **long-range order**

# Scotch tape method (in Lab 11)

© sources unknown. All rights reserved. This content is excluded from our Creative Commons license. For more information, see <https://ocw.mit.edu/help/faq-fair-use>.

## The procedure

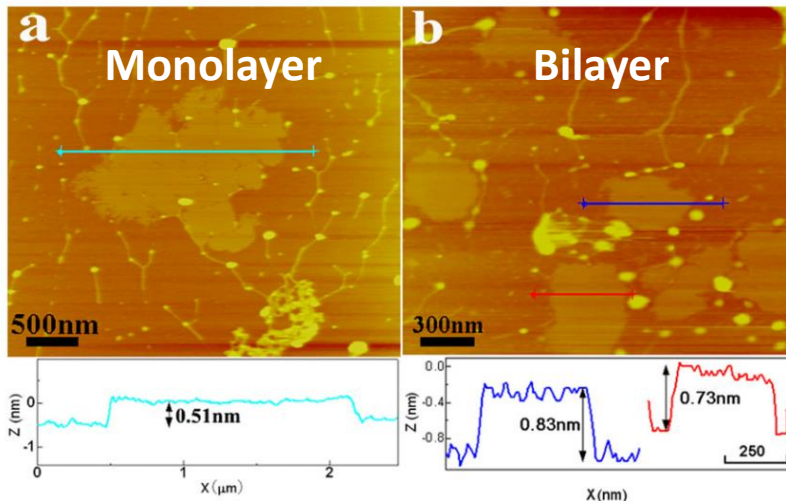

- A. Apply scotch tape on highly ordered pyrolytic graphite (HOPG) and detach the graphite from HOPG surface.
- B. Fold over the Scotch tape several times at different locations to make multiple clones of exfoliated graphite all over the sticky side of tape
- C. Repeat B for at least 30 times
- D. Place graphite with reduced number of layers on the tape, on the Si substrate and press it hard
- E. Detach the tape
- F. Observe your sample under the microscope at AFM to see if you successfully transferred graphene on the Si substrate and save the image

**Monolayer graphene** **Large scalability**

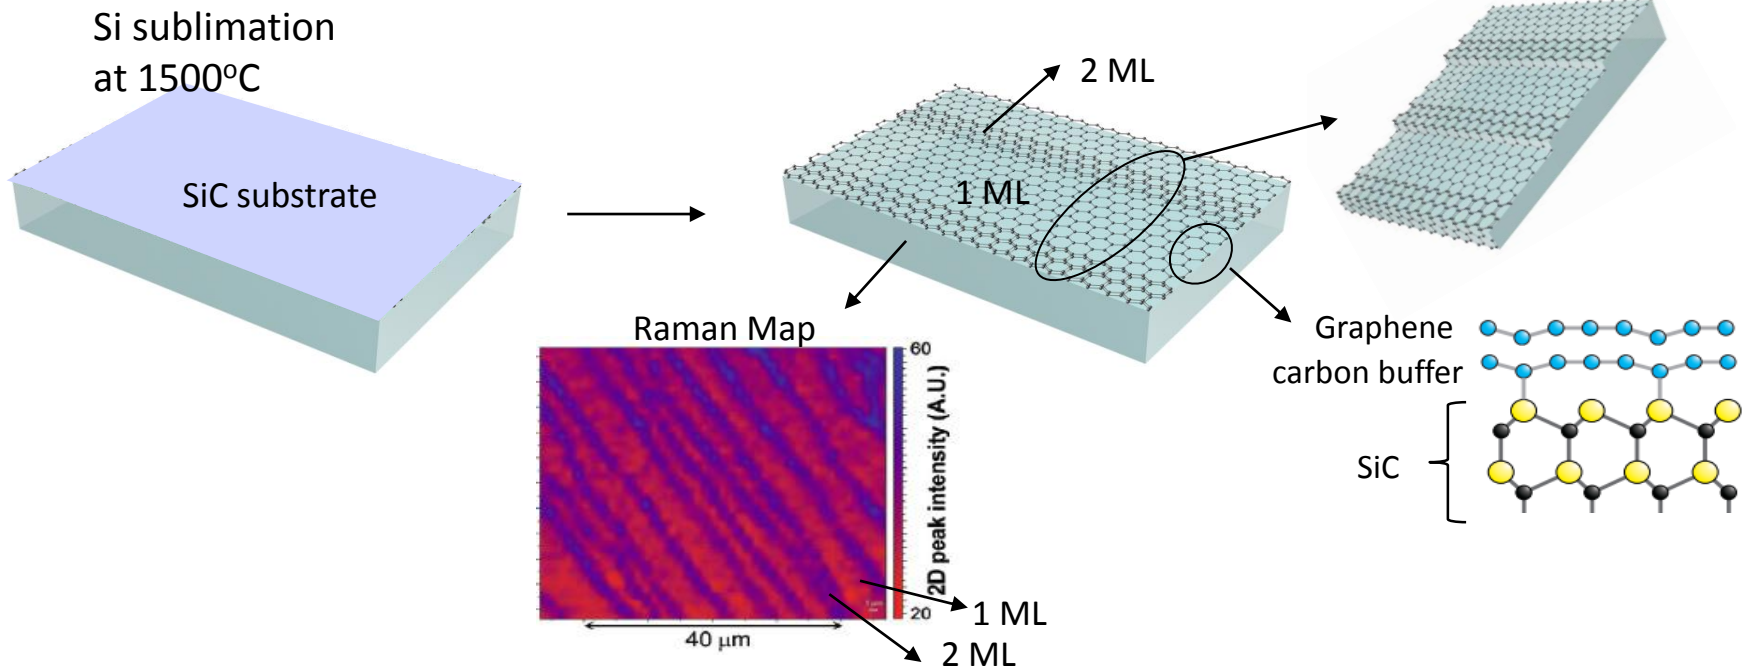

**Polycrystalline / Wrinkled** **Wet-transfer**

# Properties of CVD graphene

# Graphitization of SiC

- When SiC substrates are annealed at high temperature (above 1300 °C), Si atoms selectively desorb from the surface and the C atoms left behind naturally form monolayer graphene
  - Single-oriented flat graphene obtainable

BE (Au-G) > BE (G-G)  
BE (Au-G) << BE (Ni-G)

# 4-inch wafer-scale single-crystalline graphene

# Summary of graphene fabrication methods

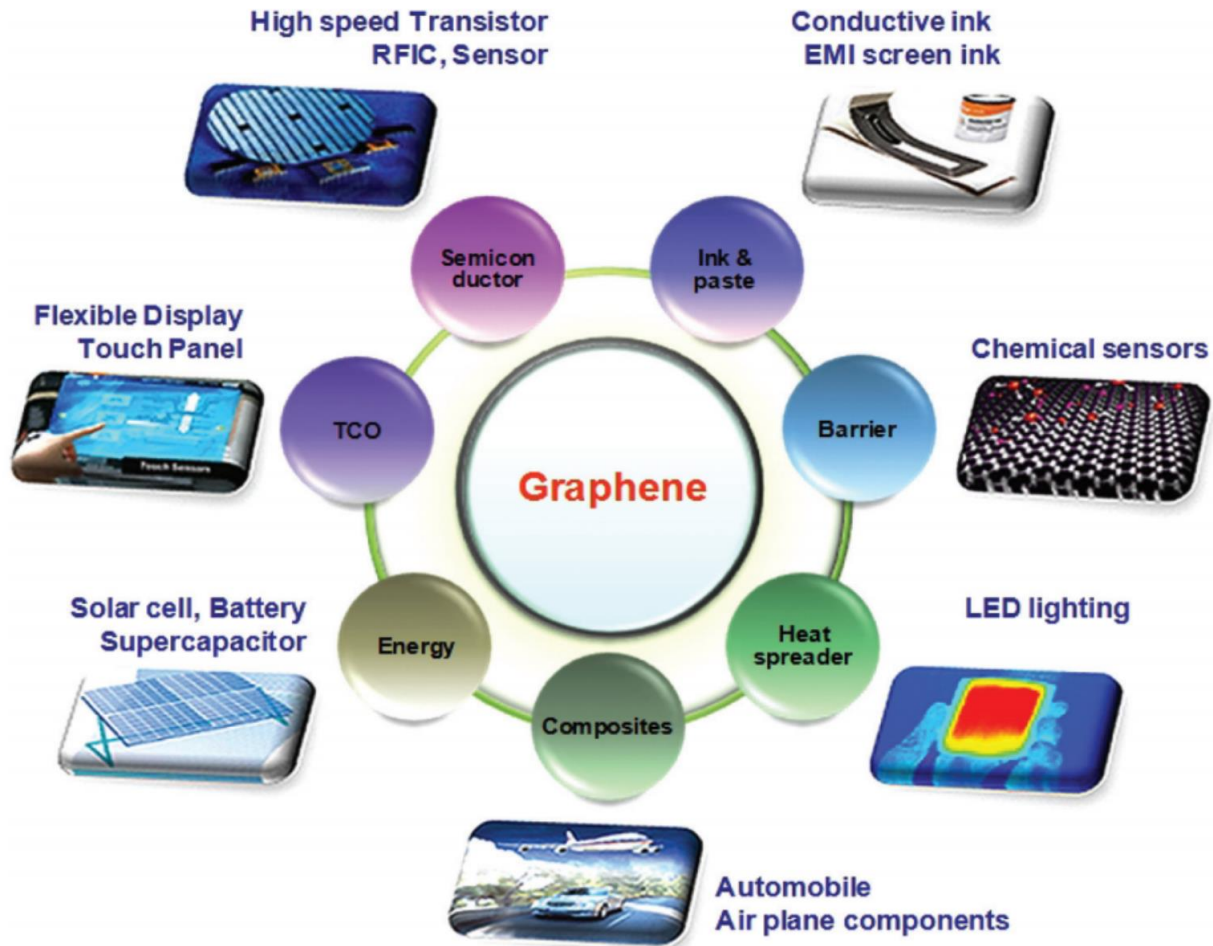

Excellent
  Good
  Poor

	Scotch Tape graphene	CVD graphene	SiC graphene	Layer-resolve Transfer
<b>Monolayer Control</b>	Uncontrollable	Self-limiting (>95% ML)	Self-limiting (1.2 ML)	
<b>Crystalline orientation</b>	Single but less than poly grain size	Polycrystal	Single	
<b>Flatness</b>	Pristine	Wrinkle from foils	Same as SiC wafer	
<b>Large-scalability</b>	~50 $\mu\text{m}$	Depending on CVD reactor size	Wafer size	
<b>Transfer efficiency</b>	Uncontrollable	Wet-transfer	Un-transferrable	
<b>Process cleanliness</b>	Dry-transfer	Wet-transfer	No transfer involved	
<b>Price</b>	Cheap	Cheap	Extremely expensive

# In Lab 11

---

- 1) Experience Nobel Prize winning method to fabricate graphene from graphite
- 2) Image different types of graphene using AFM
  - Measure thickness of monolayer graphene
  - Find thinnest graphene among graphene flakes you made
- 3) Obtain atomic image of graphene using STM

# Quiz (May 3)

---

- Examples
  - Short answer questions
    - What kind of chemical bond between PDMS and glass slide results in after O<sub>2</sub> plasma treatment and bonding of the two surfaces?  
*Covalent bonding*
  - Fill blanks
    - The ratio of inertial force over viscous force defined as,  $\rho u / \mu$ .  
This is (*Reynolds*) number
  - True or False
    - Single atom can be resolved by SEM. *F*
  - Multiple choices
