

LECTURE 6: Variance; Conditioning on an event; Multiple random variables

- Variance and its properties
 - Variance of the Bernoulli and uniform PMFs
- Conditioning a r.v. on an event
 - Conditional PMF, mean, variance
 - Total expectation theorem
- Geometric PMF
 - Memorylessness
 - Mean value
- Multiple random variables
 - Joint and marginal PMFs
 - Expected value rule
 - Linearity of expectations
- The mean of the binomial PMF

Variance — a measure of the spread of a PMF

- Random variable X , with mean $\mu = \mathbf{E}[X]$
- Distance from the mean: $X - \mu$
- Average distance from the mean?

$$\mathbf{E}[X - \mu] = \mathbf{E}[X] - \mu = \mu - \mu = 0$$

- **Definition of variance:** $\text{var}(X) = \mathbf{E}[(X - \mu)^2]$

≥ 0

- Calculation, using the expected value rule, $\mathbf{E}[g(X)] = \sum_x g(x)p_X(x)$

$$g(x) = (x - \mu)^2 \quad \text{var}(X) = \mathbf{E}[g(x)] = \sum_x (x - \mu)^2 p_X(x)$$

Standard deviation: $\sigma_X = \sqrt{\text{var}(X)}$

Properties of the variance

$$\text{var}(aX + b) = a^2 \text{var}(X)$$

$$\begin{aligned} \text{var}(3 - 4x) &= (-4)^2 \text{var}(x) \\ &= 16 \text{var}(x) \end{aligned}$$

- Notation: $\mu = \mathbf{E}[X]$

- Let $Y = X + b$ $\nu = \mathbf{E}[Y] = \mu + b$
 $\text{var}(Y) = \mathbf{E}[(Y - \nu)^2] = \mathbf{E}[(X + b - (\mu + b))^2] = \mathbf{E}[(X - \mu)^2] = \text{var}(X)$

- Let $Y = aX$ $\nu = \mathbf{E}[Y] = a\mu$
 $\text{var}(Y) = \mathbf{E}[(aX - a\mu)^2] = \mathbf{E}[a^2(X - \mu)^2] = a^2 \mathbf{E}[(X - \mu)^2] = a^2 \text{var}(X)$

A useful formula: $\text{var}(X) = \mathbf{E}[X^2] - (\mathbf{E}[X])^2$

$$\begin{aligned} \text{var}(X) &= \mathbf{E}[(X - \mu)^2] = \mathbf{E}[X^2 - 2\mu X + \mu^2] \\ &= \mathbf{E}[X^2] - 2\mu \mathbf{E}[X] + \mu^2 = \mathbf{E}[X^2] - (\mathbf{E}[X])^2 \end{aligned}$$

Variance of the Bernoulli

$$X = \begin{cases} 1, & \text{w.p. } p \\ 0, & \text{w.p. } 1-p \end{cases}$$

$$E[X] = p$$

$$\begin{aligned} \text{var}(X) &= \sum_x (x - E[X])^2 p_X(x) = (1-p)^2 p + (0-p)^2 \cdot (1-p) \\ &= p - 2p^2 + \cancel{p^3} + p^2 - \cancel{p^3} = p - p^2 = p(1-p) \end{aligned}$$

$$\text{var}(X) = E[X^2] - (E[X])^2 = E[X] - (E[X])^2 = p - p^2 = \boxed{p(1-p)}$$

$$X^2 = X$$

Variance of the uniform

$$\frac{1}{6} n(n+1)(2n+1)$$

$$\text{var}(x) = E[x^2] - (E[x])^2 = \frac{1}{n+1} (0^2 + 1^2 + 2^2 + \dots + n^2) - \left(\frac{n}{2}\right)^2$$

$$= \frac{1}{12} n(n+2)$$

$$n = b - a$$

$$\text{Var}(x) = \frac{1}{12} (b-a)(b-a+2)$$

Conditional PMF and expectation, given an event

- Condition on an event $A \Rightarrow$ use conditional probabilities

$$p_X(x) = \mathbf{P}(X = x)$$

$$\sum_x p_X(x) = 1$$

$$\mathbf{E}[X] = \sum_x x p_X(x)$$

$$\mathbf{E}[g(X)] = \sum_x g(x) p_X(x)$$

$$\underline{p_{X|A}(x)} = \underline{\mathbf{P}(X = x | A)}$$

$$\sum_x p_{X|A}(x) = 1$$

$$\mathbf{E}[X | A] = \sum_x x p_{X|A}(x)$$

$$\mathbf{E}[g(X) | A] = \sum_x g(x) p_{X|A}(x)$$

assume

$$\mathbf{P}(A) > 0$$

Example of conditioning

- Let $A = \{X \geq 2\}$

$$E[X] = 2.5$$

$$\begin{aligned} \text{var}(X) &= \frac{1}{12}(b-a)(b-a+1) \\ &= \frac{1}{12} 3 \cdot 5 = \frac{5}{4} \end{aligned}$$

$$E[X | A] = 3$$

$$\begin{aligned} \text{var}(X | A) &= \frac{1}{3}(4-3)^2 + \frac{1}{3}(3-3)^2 \\ &\quad + \frac{1}{3}(2-3)^2 = \frac{2}{3} \end{aligned}$$

Total expectation theorem

$$P(B) = P(A_1)P(B | A_1) + \cdots + P(A_n)P(B | A_n)$$

$$B = \{x = \pi\}$$

Total expectation theorem

$$P(B) = P(A_1)P(B|A_1) + \dots + P(A_n)P(B|A_n)$$

$$B = \{X=x\}$$

$$p_X(x) = P(A_1)p_{X|A_1}(x) + \dots + P(A_n)p_{X|A_n}(x)$$

for all x

$$\sum_x x p_X(x) = P(A_1) \underbrace{\sum_x x p_{X|A_1}(x)}_{E[X|A_1]} + \dots$$

\parallel
 $E[X]$

$$E[X] = P(A_1)E[X|A_1] + \dots + P(A_n)E[X|A_n]$$

Total expectation example

$$P(A_1) = \frac{1}{3}$$

$$P(A_2) = \frac{2}{3}$$

$$E[X|A_1] = 1$$

$$E[X|A_2] = 7$$

$$E[X] = \frac{1}{3} \cdot 1 + \frac{2}{3} \cdot 7$$

Conditioning a geometric random variable

- X : number of independent coin tosses until first head; $P(H) = p$

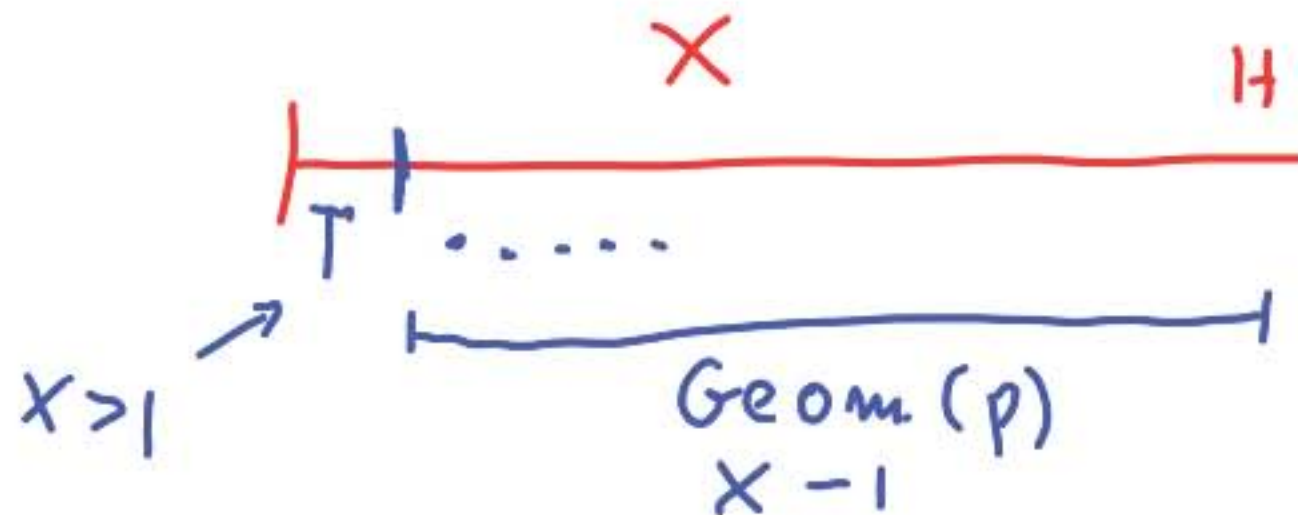

$$p_X(k) = (1 - p)^{k-1} p, \quad k = 1, 2, \dots$$

Memorylessness:

Number of **remaining** coin tosses, conditioned on Tails in the first toss, is **Geometric**, with parameter p

Conditioned on $X > 1$, $X - 1$ is geometric with parameter p

Conditioning a geometric random variable

- X : number of independent coin tosses until first head; $\mathbf{P}(H) = p$

$$p_X(k) = (1 - p)^{k-1} p, \quad k = 1, 2, \dots$$

Memorylessness:

Number of **remaining** coin tosses, conditioned on Tails in the first toss, is **Geometric**, with parameter p

Conditioned on $X > 1$, $X - 1$ is geometric with parameter p

$$\begin{aligned} P_{X-1|X>1}(3) &= P(X-1=3 | X>1) = P(T_2 T_3 H_4 | T_1) = P(T_2 T_3 H_4) \\ &= (1-p)^2 p = p_X(3) \\ P_{X-1|X>1}(k) &= p_X(k) \end{aligned}$$

Conditioning a geometric random variable

- X : number of independent coin tosses until first head; $\mathbf{P}(H) = p$

$$p_X(k) = (1 - p)^{k-1} p, \quad k = 1, 2, \dots$$

Memorylessness:

Number of **remaining** coin tosses, conditioned on Tails in the first toss, is **Geometric**, with parameter p

Conditioned on $X > \underline{n}$, $X - \underline{n}$ is geometric with parameter p

$$P_{X-1|X>1}(3) = P(X-1=3 | X>1) = P(T_2 T_3 H_4 | T_1) = P(T_2 T_3 H_4)$$

$$P_{X-1|X>1}(k) = P_X(k) = P_{X-n|X>n}(k) = (1-p)^{k-1} p = P_X(k)$$

The mean of the geometric

$$\mathbf{E}[X] = \sum_{k=1}^{\infty} k p_X(k) = \sum_{k=1}^{\infty} k (1-p)^{k-1} p$$

$$\mathbf{E}[X] = \frac{1}{p}$$

$$E[X] = 1 + E[X-1]$$

$$= 1 + p \cdot E[X-1 | X=1] + (1-p) E[X-1 | X>1]$$

$$= 1 + 0 + (1-p) E[X]$$

Multiple random variables and joint PMFs

$X : p_X$
 $Y : p_Y$

$P(X = Y) = \frac{2}{20}$

← marginal pmfs

Joint PMF: $p_{X,Y}(x,y) = P(X = x \text{ and } Y = y)$

$P_X(3)$

$P_{X,Y}(1,3) = \frac{2}{20}$

$P_X(4) = \frac{1}{20} + \frac{2}{20}$

$P_Y(2) = \frac{1}{20} + \frac{3}{20} + \frac{1}{20}$

$\sum_x \sum_y p_{X,Y}(x,y) = 1$

$p_X(x) = \sum_y p_{X,Y}(x,y)$

$p_Y(y) = \sum_x p_{X,Y}(x,y)$

More than two random variables

$$p_{X,Y,Z}(x, y, z) = \mathbf{P}(X = x \text{ and } Y = y \text{ and } Z = z)$$

$$\sum_x \sum_y \sum_z p_{X,Y,Z}(x, y, z) = 1$$

$$p_X(x) = \sum_y \sum_z p_{X,Y,Z}(x, y, z)$$

$$p_{X,Y}(x, y) = \sum_z p_{X,Y,Z}(x, y, z)$$

Functions of multiple random variables

$$Z = g(X, Y)$$

$$\text{PMF: } p_Z(z) = \mathbf{P}(Z = z) = \mathbf{P}(g(X, Y) = \underline{z}) = \sum_{(x, y) : g(x, y) = z} p_{X, Y}(x, y)$$

$$\text{Expected value rule: } \mathbf{E}[g(X, Y)] = \sum_x \sum_y \underbrace{g(x, y)} \cdot \underline{\underline{p_{X, Y}(x, y)}}$$

$$E[g(x)]$$

Linearity of expectations

$$E[aX + b] = aE[X] + b$$

$$E[X + Y] = E[X] + E[Y]$$

$$E[X + Y] = E[g(x, y)]$$

$$(g(x, y) = x + y)$$

$$= \sum_x \sum_y (x + y) P_{X, Y}(x, y)$$

$$= \underbrace{\sum_x \sum_y x P_{X, Y}(x, y)} + \sum_x \sum_y y P_{X, Y}(x, y)$$

$$= \sum_x x \underbrace{\sum_y P_{X, Y}(x, y)} + \underbrace{\hspace{10em}}$$

$$= \sum_x x P_X(x) + \sum_y y P_Y(y) = E[X] + E[Y]$$

Linearity of expectations

$$\mathbf{E}[aX + b] = a\mathbf{E}[X] + b$$

$$\mathbf{E}[X + Y] = \mathbf{E}[X] + \mathbf{E}[Y]$$

$$\mathbf{E}[X_1 + \cdots + X_n] = \mathbf{E}[X_1] + \cdots + \mathbf{E}[X_n]$$

$$\mathbf{E}[2X + 3Y - Z] = \mathbf{E}[2X] + \mathbf{E}[3Y] - \mathbf{E}[Z] = 2\mathbf{E}[X] + 3\mathbf{E}[Y] - \mathbf{E}[Z]$$

The mean of the binomial

- X : binomial with parameters n, p
 - number of successes in n independent trials

$$\mathbf{E}[X] = \sum_{k=0}^n k \binom{n}{k} p^k (1-p)^{n-k}$$

$P_X(k)$

$$\mathbf{E}[X] = np$$

$X_i = 1$ if i th trial is a success; p
 $X_i = 0$ otherwise $1-p$ (indicator variable)

$$X = X_1 + \dots + X_n$$

$$E[X] = \underbrace{E[X_1]}_p + \dots + \underbrace{E[X_n]}_p = np$$
